SELECTED CORRELATIONS OF POST-CRITICAL BELIEVES

S u m m a r y

Inspired by the thinking of Ricoeur, Wulff proposed a new and interesting approach the subject of religion. According to Wulff there are four vies on religion which can be put in twodimensional space.

The article describes Wulff theoretical model and discusses its usefulness in empirical research of religiousness. Then The Hutsebaut Post-critical Belief Scale (PCBS) is presented.

The last part of the paper supports results of empirical research on connection between post critical belies and some psychological factors.
